INTEGRATED METAL ENCLOSURES

vfpinc.com

Your Safeguard For Critical Components

VFP metal integrated structures offer prefabricated construction capable of withstanding wind speeds of 130 mph at approximately 50% of the weight of concrete structures. They are ideal for rooftop sites, helicopter lifts to remote or inaccessible locations, portable data centers, and oil rig control centers.

FEATURES & BENEFITS

» CONSTRUCTION

Metal shelters are assembled using a VFP-manufactured and proprietary interlocking galvanneal metal wall and roof panels. Insulated and sealed for extreme weather environments, this innovative manufacturing design provides the flexibility to accommodate any equipment or site consideration.

» PERFORMANCE

Equipment protection and maintaining the proper operating environment are critical to maximizing system uptime. VFP metal shelters easily meet that challenge, exceeding all domestic building codes. With installed accessories specific to local building codes, metal shelters withstand the most severe weather conditions on the planet. No matter the location, VFP shelters keep critical systems operational.

» CONFIGURATION

Standard, single-unit metal shelters are available in widths up to 16 feet with ceiling heights of up to 10 feet. Custom modular shelters are available in many configurations with standard widths of 40 feet and lengths of 100 feet or more.

» EXTERIOR FINISHES

In addition to the standard painted exterior finish, VFP offers a wide range of options for siding and roof treatments to suit specific site requirements. Brick, block, and horizontal siding are among the many finishes available. Optional roof designs include decorative metal, mansards, and pitched gables. Where zoning or other considerations are required, we can design the shelter to blend into the neighborhood.

» INTERIOR FINISHES

The structure interior finishes include commercial, light-colored, vinyl tile floors. Proprietary wall and ceiling panels have a white laminate finish and provide a secure mounting surface for installed equipment. Walls, floor, and ceiling panels include high-performance insulation to meet your site requirements.

» CUSTOMIZATION

VFP can specify, plan, and install the power distribution components, generators, Uninterruptible Power Systems, DC power systems, HVAC equipment, lighting, alarms, grounding, and more, all to customer specifications. In fact, we can supply and install communications equipment, relay racks, and customer-furnished equipment. Additionally, VFP will coordinate shelter delivery to the site, including all over-the-road permitting and on-site crane operation. Integral lifting points make off-loading and placement on the foundation easier and allow metal shelters to be installed on a wide variety of foundations unique to each site and application.
